

Advanced software to empower knowledge

In collaboration with partners and communities of international reference, we develop software in step with the future for the innovation of libraries, museums and archives

Our history Software House, with over 20 years of experience, in 2020 becomes part of Gruppo [Casalini Libri](#) S.p.A. as its technology partner, uniting objectives and skills to offer superior and more advanced products/services.

We orient our activities toward consulting, planning and developing technological solutions aimed at:

- **Data Management**, systems for the administration and enhancement of information patrimonies
- **Data Conversion**, processing of personal data so that it can be transformed into structured data
- **Data Exploration**, search tools and the fruition of information on the web

As System Integrator we facilitate the acquisition/integration of preexisting systems, or create new functional structures, also developing with open source technologies selected among those of international standards.

Semantic Web and linked data technologies

The result of our extensive experience, at an international level, has allowed us to be among the first PMIs in Italy to focus on methodological processes, best practices, and Web semantic technologies and Linked Open Data (LOD), obtaining a leadership position in cultural heritage.

We manage the entire process guaranteeing the highest quality standards (5 stars):

- Creation/publishing of datasets in LOD
- Selection, integration and planning of ontologies
- Interlinking to create a network of knowledge that is both distributed and interoperable
- Engineering of search engines, LOD visualization and fruition

We are present and participate in primary international events, in both academic and theoretical settings, collaborating with private entities universities and research institutions.

R&D Our [Research & Development](#) activity, in national and international contexts, has allowed us to improve products and processes, or to create new ones, guaranteeing technological innovation and results that would have been otherwise unattainable.

We pursue a [partnering](#) strategy that works to enhance and increase skills and competitiveness, founded on relationships with qualified individuals with whom we collaborate in a synergetic manner.

Products/Services [Products and services](#) converge toward a common goal: interpret change and meet actual demands. Tools to innovate or improve work methods and processes, always attentive to facilitating adoption and simplifying usage.

Share Family Creating connections between libraries, museums and archives to share knowledge. The growing interest toward projects based on **LOD Platform** technology, for the transition from traditional cataloguing settings to innovative linked data models, has determined a significant increase of initiatives throughout the world.

From the initial SHARE Catalogue, that involved the universities of Southern Italy, and SHARE-VDE, a new project has now been conceived and is being developed: [SHARE Family](#); an ensemble of projects that share the common objective of safeguarding the future of catalogues by creating efficient environments that facilitate cataloguing, identification and enrichment of bibliographic records in linked data.
